Subject Index

1q21.1 genome location, 375–376, 378, 381

A

A Defense of Beanbag Genetics (Haldane), 403

Aardvark, 85

ABC (approximate Bayesian computation), 398

Acanthaceae, 260

Acetyl-CoA, 388, 389

Acoel flatworms, 66, 70

Adaptation

- basis of quantitative variation, 140
- conclusions, 143
- effect of beneficial mutations, 140–141
- gradualist view of evolution, 139
- identifying genes responsible for, 141–142
- in natural populations, 142
- theory of polygenic variation, 139

Adaptive evolution

- background to current research, 41–42
- conclusions, 46
- cytochrome P450 BM3 model, 42–44
- described, 42
- functional promiscuity of proteins and, 45

- novel protein generation by recombination, 45–46
- role of neutral mutations in, 45

Adenomatous polyposis coli (APC), 83–85

Afar Depression, Ethiopia, 335, 340

Africanized honey bees (AHB), 424

African populations. *See* Genetic structure in African populations

African violet (*Saintpaulia*), 264

AGO3, 227–229

Agouti, 165

Agrobacterium, 307

AHB (Africanized honey bees), 424

Alberts, Bruce, 465

Allele swaps, 151

Altruism and sociobiology, 408

Alu (sc*Alu*), 366

Alu RNAs, 369–370

Alu SINE, 363, 366–367

Alu/snaR-related (ASR), 363, 366

Amborella, 270

Amphimedon

- Hedgehog signaling and, 86–87
- Notch pathway and, 82–83
- TGF- β signaling pathway and, 86, 88
- WNT pathway and, 83, 85

Amplicons, 345, 348, 349–350, 351

Angelman syndrome, 390

Ant (*Lasius niger*), 423

Antirrhinum (snapdragon), 264

APC (adenomatous polyposis coli), 83–85

Ape evolution and copy-number variation, 375–377

Apolipoprotein(a), 38

Approximate Bayesian computation (ABC), 398

Arabidopsis sp., 262, 263, 309, 310

Arabidopsis thaliana, 104–105, 304, 413–414

Ardipithecus ramidus, 340

Argonaute, 226–227

Argonaute, 272

Artificial selection. *See* Adaptive evolution

Aspergillus, 106

ASR (*Alu/snaR*-related), 363, 366

Association mapping, 150

ATP, 388, 389

Au. africanus and hominid diversity, 339–340

Aubergine, 227–229

Australopithecus, 336, 340

Autism, 378

Aveling, Edward, 1

Axin, 83

B

Bacterial cell cycle of *Caulobacter crescentus*

- conclusions, 62
- entry into S phase
- master regulators' functions, 55–56
- modes of DnaA and CtrA regulation, 56–58
- prevention of improper replication
- initiation in other bacteria, 58
- replication licensing in eukaryotes, 58

final cell division stage

MipZ communication of information, 60–61

systems used by other bacteria, 61–62

life cycle, 55

post-S phase

chromosome segregation process, 59

discovery that the chromosome is structured, 59–60

DNA mobility within the nucleus, 60

timing of replication and segregation, 58–59

Bantu expansion, 395

Bar locus, 355

Basal chordates, 36–37

Basal metabolic rate (BMR), 431

Bat limb development. *See* *Carollia persipillata* (short-tailed fruit bat)

Bauhinia, 261

Bayesian clustering, 397

β -catenin, 84, 85

Beckwith-Wiedemann syndrome, 390

Beetle horns. *See* Horned beetles

Behavior and evolution. *See* Cultural evolution of words; Evo-devo and the evolution of social behavior; Sociobiology

Behe, Michael, 455, 466

Benzer, Seymour, 131

Bioenergetics and epigenomics

bioenergetic hypothesis for common diseases, 390

calorie intake and cellular growth and reproduction, 387–389

cellular evolution and, 385–386

conclusions, 392

epigenome origins and, 387–389

epigenomic disease and, 389–391

in human origins and disease, 386–387

intraspecific energy resource

adaptation, 383–385

mtDNA mutations accumulations, 387

paradigm in animal evolution and human disease, 391–392

Biola University, 458

Biological catalysis

“disappearing RNA” hypothesis, 14–15

essential activities of genetic material, 11

evidence of new catalytic RNPs, 15

questions regarding evolution of

chirality establishment, 12

encapsulation of self-replicators, 12–13

environmental conditions, 12

first self-replicating molecules, 12

RNP enzyme defined, 11–12

scenarios for evolution of an RNP World

early binding of small molecules, 13

evolution of an RNP enzyme, 14

evolution of telomerase RNP, 14

middle step of RNA synthesis, 13

pathways, 13

Biological Species Concept (BSC), 198

Biston betularia (peppered moth), 159, 164

BLADE ON PETIOLE (BOP), 262

Blood coagulation evolution in vertebrates

arrangements of subsidiary domains, 35

basal chordates, 36–37

challenges to “irreducible complexity”

argument, 465–467

complexity of system, 39

conclusions, 39–40

fibrinogen γ chain, 38

jawless fish, 37–38

origins of clotting, 38–39

pathway in humans, 35, 36f

search for relevant genes in genome

database, 35–36, 37t

BMR (basal metabolic rate), 431

Boyd, E., 443

Bradley, Walter, 456

Brassicaceae, 262

Brinker (*brk*), 277

 Cnidarians, 66
 Coat color in mammals, 320–322. *See also* Phenotypic evolution in domestic animals
 Cognition
 behavioral adaptation to the environment and, 249–250
 behavioral roles for synapse evolution, 255
 conclusions, 256
 defined, 249
 DUF1220 domains link to cognitive brain disease, 378–380
 evolutionary basis of synapse composition, 254
 implications of postsynaptic complexity as a source of synapse diversity, 255–256
 molecular evolution and development of the postsynaptic proteome, 252–254
 molecular organization of the postsynaptic proteome, 250–252
 neurophysiological consequences of expansions in postsynaptic complexity, 254–255
 patterns of neural activity and, 250
 in unicellular organisms, 249–250
 Cold Spring Harbor Laboratory, 335, 336–338, 403, 469
 Complementation and robustness, 111–113
 Concerted evolution, 217
 Continuous in vitro evolution, 18–19
 Cooking and a high-quality diet
 conclusions, 432
 digestibility of food and, 429–430
 ease of chewing and, 429
 energy expenditure for humans versus chimpanzees, 427
 evolutionary adaptation to cooked food, 431–432
 heat effects on protein, 430
 human need to consume high-energy-density foods, 427
 meat eating's importance in human evolution, 427–428
 meatless diet's impact on energy status and reproductive function, 428
 net energy gain and
 lowering of diet-induced thermogenesis, 430
 lowering of metabolic costs of immune disease, 431
 raw diet's impact on energy status and reproductive function, 428
 Copy-number gain and loss, 359, 375–377
 Cos2, 87

 TGF- β signaling pathway, 85–86, 88
 Thaxton, Charles, 456
 Theory of evolution and Darwin, 1–2
 Thrifty gene hypothesis, 322
 Thrombin, 38–39
Tianzhushania, 68
 Toadflax (*Linaria*), 264
 Tooby, John, 446
 Total daily energy expenditure (TEE), 427
Tragopogon system
 compared to well-studied systems, 220–221
 genomic approaches to studying, 219
 history of the polyploids, 216
 homeolog loss and gene silencing, 217–218
 mechanism of gene loss, 219
 multiple origins of the polyploids, 216–217
 rDNA loci and concerted evolution, 217
 synthetic lines creation, 217
 tissue-specific silencing, 219
 Translesion synthesis polymerases, 97–98
 Transposon control pathways in *Drosophila*
 coevolution of transposons and their control pathways, 227–229
 conclusions, 232
 hybrid dysgenesis and the piRNA pathway, 231–232
 long- and short-term evolution of transposon silencing, 229–231
 positive effects of transposon activity, 225
 potential detrimental effects of unregulated transposon activity, 225
 small RNA-based pathways and, 226–227
 speciation and the piRNA pathway, 231–232
 threat posed by transposons, 228
 transposable element diversity and, 226
 transposon definition and mechanism of function, 225
 uses of soma-derived RNAs, 231
 Tree of Life (TOL)
 arguments against, 201–203
 concept of, 205
Trichoplax
 Hedgehog signaling and, 87
 Notch pathway and, 82
 TGF- β signaling pathway and, 86, 88
 WNT pathway and, 85
 tRNA
 binding sites for, 25
 decoding by
 distortions in tRNA during decoding, 28, 29f
 minor-groove recognition by RNA, 27–28
 minor-groove recognition's role in evolution, 28
 Typological thinking in prokaryotic evolution, eradicating. *See* Prokaryotic systematics and evolution
- ## U
- Understanding Intelligent Design: Everything You Need to Know in Plain Language* (Dembski and McDowell), 460
- ## V
- Variation of Animals and Plants Under Domestication* (Darwin), 319, 322

SUBJECT INDEX

485

VA RNA_{II}, 363–364
 Veblen, Thorstein, 449
 Ventral nerve cord (VNC), 242, 244
Vernanimalcula, 68
 Vertebrate blood coagulation. *See* Blood coagulation evolution in vertebrates
 Vestigial structures, 263
 Virus evolution prediction
 conclusions, 117
 demonstration of evolution of robustness, 111–113
 experimental evolution and evolutionary biology, 110
 investigation of robustness mechanism, 115–116
 link between robustness and evolvability in RNA virus ϕ 6, 113–115
 mathematical theory applied to evolutionary biology, 109–110
 relationship between robustness and evolvability, 113
 robustness and the genotype-to-phenotype translation, 110–111
vitellogenin, 423
 VNC (ventral nerve cord), 242, 244
Vnd, 277

v-Src, 105

W

Walker A cytoskeletal ATPase (WACA), 60
 Wallace, Alfred Russel, 1, 5, 139
 Washburn, S., 337, 338
 Wasp (*Nasonia vitripennis*), 412
 Wedge Strategy, 456, 457
 Wells, Jonathan, 455
Welwitschia mirabilis, 270
 Werner syndrome, 390
 West, John, 455
 Whole-genome sequence (WGS)
 databases, 35, 37t
 Wilberforce, Samuel, 2
 Williams, G.C., 414
 Wilm's tumor, 390
 Wilson, D.S., 405
 Wilson, E.O., 403, 410, 411
 WNT pathway, 83–85
 Wood mouse (*Peromyscus*), 142, 160, 163
 Wrangham, Richard, 446
 Wright, Sewall, 134, 469
 Wynne-Edwards, V.C., 404, 405

X

X chromosome. *See* Sex chromosomes in

vertebrates

Y

Yates, Edmund, 6
 Y chromosome. *See* Sex chromosomes in vertebrates
 Yeast traits analysis
 approaches to dissecting complex traits
 mapping complex traits to genomic loci, 150–151
 refining QTLs to genes or causal polymorphisms, 151
 challenges associated with genetic analysis, 145
 conclusions and future prospects, 149–150, 151–152
 insights from BYxRM cross
 gene expression traits showing complex inheritance, 146–147
 genetic dissection of traits, 147–149
 molecular mechanisms of gene expression variation, 147
 QTL hot spots importance, 149
 summary, 149
Your Inner Fish (Shubin), 465
